# MSDS 7330
# FILE ORGANIZATION AND DATABASE MANAGEMENT
# IN CLASS ASSESSMENT UNIT 9

1. What is database partitioning?
   - A. Dividing a large database into smaller, more manageable parts
   - B. A technique for improving the performance of database queries
   - C. A way to reduce the storage space required for a database
   - D. All of the above

2. What are the benefits of database partitioning?
   - A. Improved performance
   - B. Increased scalability
   - C. Easier manageability
   - D. All of the above

3. What are the different types of database partitioning?
   - A. Range partitioning
   - B. Hash partitioning
   - C. List partitioning
   - D. All of the above

4. Which type of partitioning is best for filtering data based on a specific range of values?
   - A. Range partitioning
   - B. Hash partitioning
   - C. List partitioning
   - D. It depends on the specific data and query

5. Which type of partitioning is best for evenly distributing data across multiple partitions?
   - A. Range partitioning
   - B. Hash partitioning
   - C. List partitioning
   - D. It depends on the specific data and query

6. Which type of partitioning is best for storing data in a specific order?
    - A. Range partitioning
    - B. Hash partitioning
    - C. List partitioning
    - D. It depends on the specific data and query

7. What are the drawbacks of database partitioning?
    - A. Increased complexity
    - B. Reduced performance for some types of queries
    - C. Increased storage space requirements
    - D. All of the above

8. When should you consider partitioning a database?
    - A. When the database is very large
    - B. When the database is frequently accessed by multiple users
    - C. When the database needs to be scaled up or down easily
    - D. All of the above

9. What are some best practices for database partitioning?
    - A. Carefully consider the partitioning scheme before partitioning the database
    - B. Monitor the performance of the database after partitioning to ensure that it is meeting your needs
    - C. Use partitioning to improve the performance of queries that are frequently executed
    - D. All of the above

10. What is a partition key?
    - A. The column used to determine which partition a row of data will be assigned to
    - B. A unique identifier for each partition
    - C. A column that is used to index the data in each partition
    - D. All of the above
