

DS 7330

File Organization and Database Management

Mini Project 6

Name:

This is a mini project for DS 7330, File Organization and Database Management. For this assignment, turn in a single pdf file containing all of your answers. The file should be named `{yourLastName}_MiniProject-Number.pdf`. For example, the file name for my mini project 1 would be 'RafiqiMiniProject-1.pdf'. Insert your answer pages into this file with the answer for Question 1 inserted immediately after Question 1 and before Question 2, the answer for Question 2 inserted immediately after Question 2, and the answer for Question 3 inserted immediately after Question 3. You may insert a front page containing your name and date if you do not wish to or cannot electronically add that information to the first page of this homework sheet.

Collaboration is expected and encouraged; however, each student must hand in their own homework assignment. To the greatest extent possible, answers should not be copied but, instead, should be written in your own words. Copying answers from anywhere is plagiarism, this includes copying text directly from the textbook. Do not copy answers. Always use your own words and your own code. Directly under each question list all persons with whom you collaborated and list all resources used in arriving at your answer. Resources include but are not limited to the textbook used for this course, papers read on the topic, and Google search results. Don't forget to place your name on the first page of the pdf document.

MySQL Database

Use the Python Application we built during the live session to Add employees, View all employees, and view specific employees. The current code hardcodes three queries.

1. **Your task is to convert them into a stored procedure call in the Python code. This means you will also need to add stored procedures in the backend (MySQL).**
 - a. Functions in Python code to be updated – **(10 points total)**
 - b. Create three stored procedures in MySQL – **(10 points total)**
 - c. Document Python code and Stored procedures — **(5 points total)**
2. **In the View_Specific_Employee function**, you will need to ensure that the Python code and stored procedures are highly flexible and suitable for handling multiple search criteria, allowing users to filter based on whichever combination of **Employee ID**, **Name**, or **Department ID** they choose to provide. If neither of these parameters is present, you will return all the rows. – **(40 points total)**
3. Please **execute the following test cases**.
 1. Insert following three records. **(10 points total)**
 - a. EmpID = 6, Name = Victor, Salary = 88000, Department_ID = 102 – (5 Points)
 - b. EmpID = 9, Name = Nancy, Salary = 78000, Department_ID = 103 – (5 Points)
 2. View All Employees – **(5 Points total)**
 3. View Select Employees — **(20 points total)**
 - a. Test Case #1 ⇒ EmpID = 3 — (5 points)
 - b. Test Case #2 ⇒ Name = Charlie — (5 points)

- c. Test Case #3 $\Rightarrow$ DepartmentID = 102 — (5 points)
- d. Test Case #4 $\Rightarrow$ Leave everything blank — (5 points)

Submission: For each of these items please take screenshots of the GUI and backend to make it easier to verify your answer. For example, I want to see what data you have in your database when you start, and after inserting new rows.
